# 1 Figure 2A

Giant Component

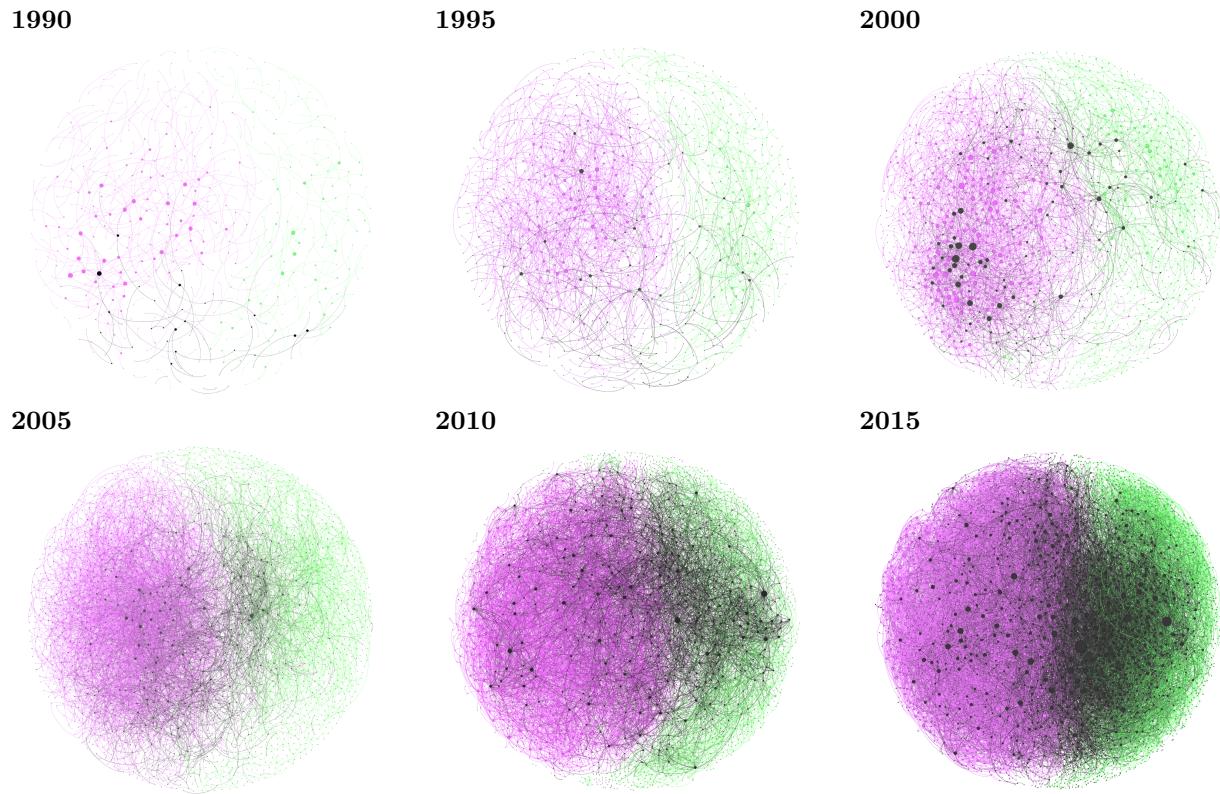

Figure 1: Growth of cross-disciplinary social capital

Evolution of the giant component in the U.S. biology-computing network. Green and magenta nodes represent faculty  $F_i$  with BIOF and CSF affiliation, respectively; black nodes represent faculty  $F_i$  that, by time  $t$ , published at least one cross-disciplinary publication and joined the XDF group; node size is proportional to the logarithm of the degree centrality,  $\ln C_{Di}$ , of  $F_i$  at time  $t$ .

## 10 Supplementary S2

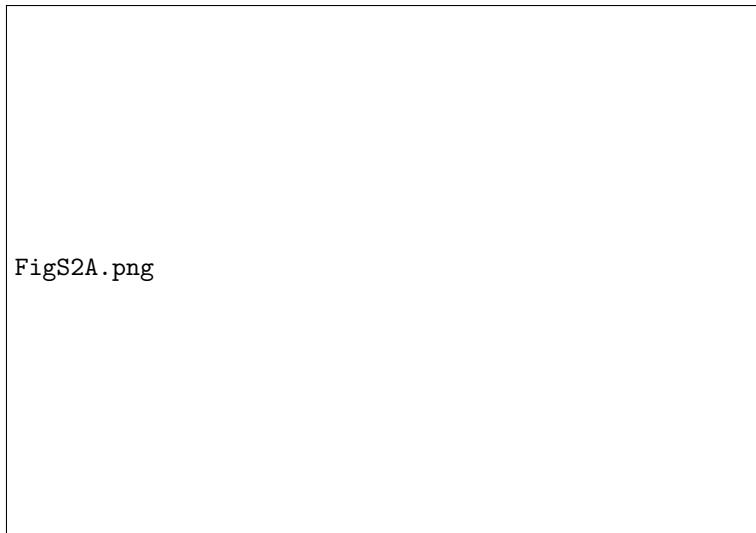

Figure 3: Network Distributions for Direct and Mediated Associations of Biologists

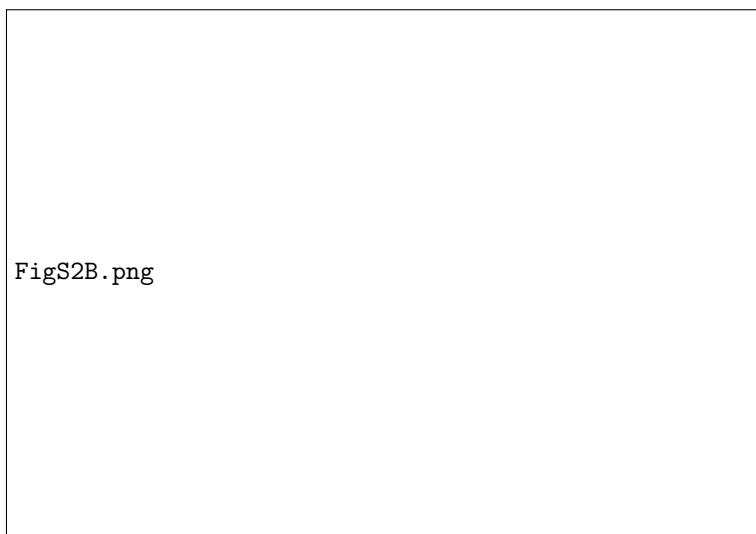

Figure 4: Network Distributions for Direct and Mediated Associations of Computer Scientists

Figure S2 depicts the number of associations between professors within biology departments (a), and computer science departments (b) with other researchers studying genomics. The dark area shows counts the direct connections between professors, while the lighter orange area shows counts of mediated connections. Vertical lines represent means of each distribution. Direct links are made when professors within the dataset collaborate to publish a paper. Mediated links are established when professors have a collaborator in common. The histograms above demonstrate the importance of the mediated connections, with regards to the robustness of the network.

## 11 Supplementary S3

Centrality

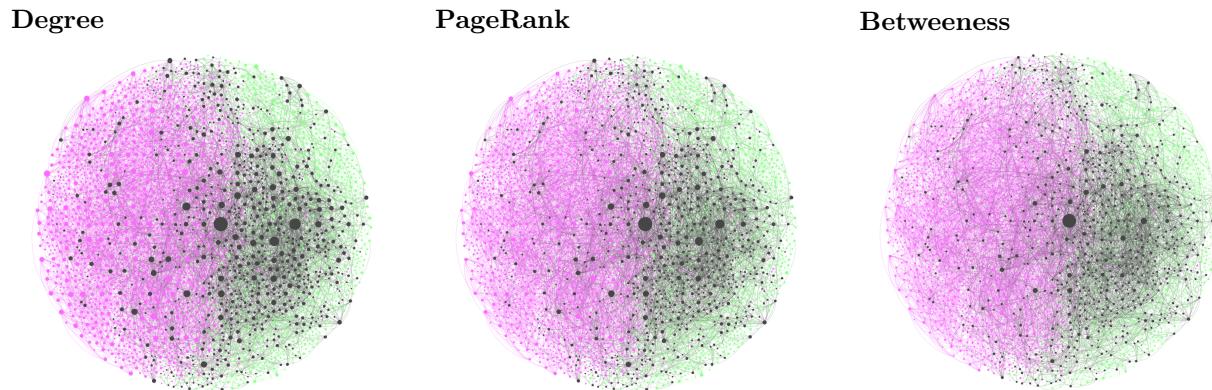

Figure 5: Three perspectives on the centrality of Fi in the direct collaboration network

Shown is the giant connected component of the faculty network  $F$  using all data up to 2015. The nodes and links across each network are fixed, only the node sizes vary according to the indicated centrality measure. Notably, the most central according to each of the three measures is Eric Lander, one of the leaders of the HGP.

## 12 Supplementary S4

Dismishing of Giant Component

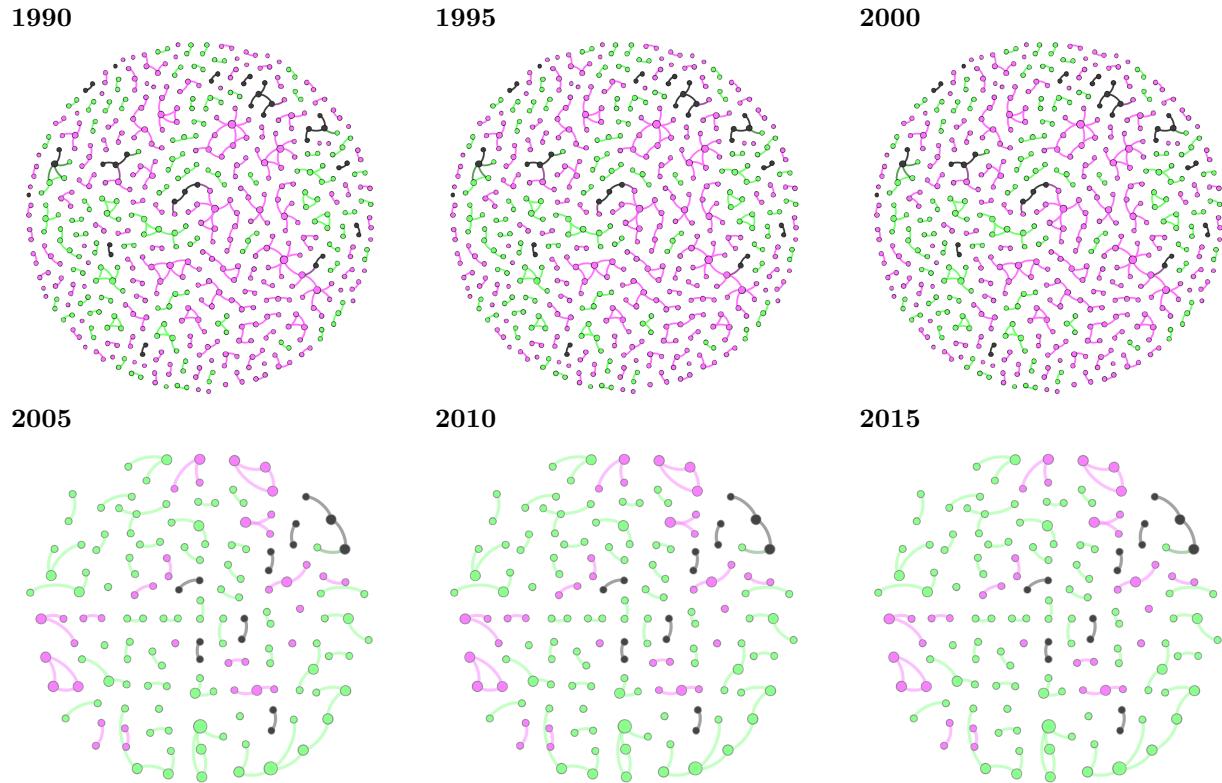

Figure 6: Growth of cross-disciplinary social capital

Green and magenta nodes represent faculty  $F_i$  with BIO and CS affiliation, respectively; black nodes represent faculty  $F_i$  that by time  $t$  collaborated with at least one faculty from the opposite department and thus joined the XD group.
